DOCUMENT MANAGEMENT PROJECT FOR SAN MARINO

Pilot project for the introduction of the “DoQui” solution in the Republic of San Marino, as Open Source document management solution

Duration: 2009-2014

The Republic of San Marino is currently enforcing a set of eGovernment interventions to implement digital signature management and to eliminate the need for paper documents.

Moreover, a project for the introduction of digital documentation management for the Public Administration has been long under way. This latter project includes protocol and archive management, enabling electronic storage of documents and the management of the historic archive.

With a view to this developments, the Republic of San Marino considered particularly interesting the choice of an Open Source environment adopted in the Piedmont Region. Moreover, during some meetings with CSI Piemonte to analyse more in depth the case study, the Republic identified a remarkable synergy with the DoQui project implemented for the Piedmont Public Administrations.

Therefore, CSI Piemonte presented a proposal for a training, methodological, project and technical support consultancy for the adoption of some DoQui modules in the structures of the Republic of San Marino. The project team will deal with the introduction of DoQui, its configuration and adjustment to the specific organization and functional needs of the Republic.

The Consortium will also provide its support during a first training phase, to enable the Economic Programming, Data Processing Centre and Statistics Office of the Republic to customise the software, manage it and ensure its maintenance, for the introduction of the new solution for final users.

Partners: CSI Piemonte (Italy)

Beneficiary: Republic of San Marino
